Installation steps for both s-curve and flat concrete tile*

per UL2703 reference installation

STEP 1: Select a tile in the area of the roof rafter.

STEP 2: Remove the tile by pushing and pulling. It is usually held in place by a small nail.

STEP 3: Using an electronic stud finder (recommended), or other means, locate the rafter center. Mark a reference point on the tile above.

STEP 5: Insert the lag bolt and washer through the TileTrac® and apply fresh compatible sealant to the base.

STEP 6: Fasten lag screw until seated. Do not overtighten. The sealant should flow outward sealing any holes.

Tip: Use a cordless impact wrench.

STEP 7: After bolting the base to the roof, slide the upper carriage into the correct position under the crown of the tile. For flat tile, slide the upper carriage near the middle of the tile.

STEP 8: Install subflashing and seal as needed if double flash is desired.

Tip: Use a Rotary Hammer drill for a 5 second drill time.

STEP 9: Replace the tile by lining up the snap lines and mark the drill location accordingly.

STEP 10: Using a 1/2" carbide drill bit and ROTARY HAMMER DRILL in hammer mode, drill through the tile. See online video at www.prosolar.com for details.

Step 11: Insert threaded stud through tile and hand-tighten to engage with base. Bind two 3/8" nuts (included) using 9/16" wrenches and tighten.

Tip: Bind (2) 3/8" nuts to top of stud prior to roof work.

STEP 12: Unbind nuts and remove from stud. Apply sealant around stud at tile opening and compress with Stainless Steel flashing (included) until seated.

Step 13: Fasten rail with lower and upper 3/8" nuts/washers as shown.

*Not recommended for clay or slate tiles. TileTrac® tested and approved for use only with the ProSolar® RooTrac® rail mounting system.
